

DEALING WITH VARIANTS IN HISTORIC SCRIPTS

OR, MAKING OLD ITALIC AND CUNEIFORM GREAT AGAIN

DEBORAH ANDERSON, SCRIPT ENCODING INITIATIVE, UC BERKELEY

ADAM ANDERSON, MELLON POSTDOCTORAL FELLOW IN THE DIGITAL HUMANITIES, UC BERKELEY

KAMAL MANSOUR, LINGUISTIC TYPOGRAPHER, MONOTYPE

FORMAT FOR THIS SESSION

Case studies:

- Adam Anderson on Cuneiform
- Debbie Anderson on Old Italic

Viewpoint from Kamal Mansour, Monotype

DEALING WITH VARIANTS IN HISTORIC SCRIPTS – OLD ITALIC

- Debbie Anderson
 - 2002- Script Encoding Initiative (Dept. of Linguistics, UC Berkeley)
 - UC Berkeley representative to Unicode Consortium
 - Unicode Technical Director
 - Background: Ph.D. Indo-European Studies (Linguistics)

DEALING WITH VARIANTS IN HISTORIC SCRIPTS – OLD ITALIC

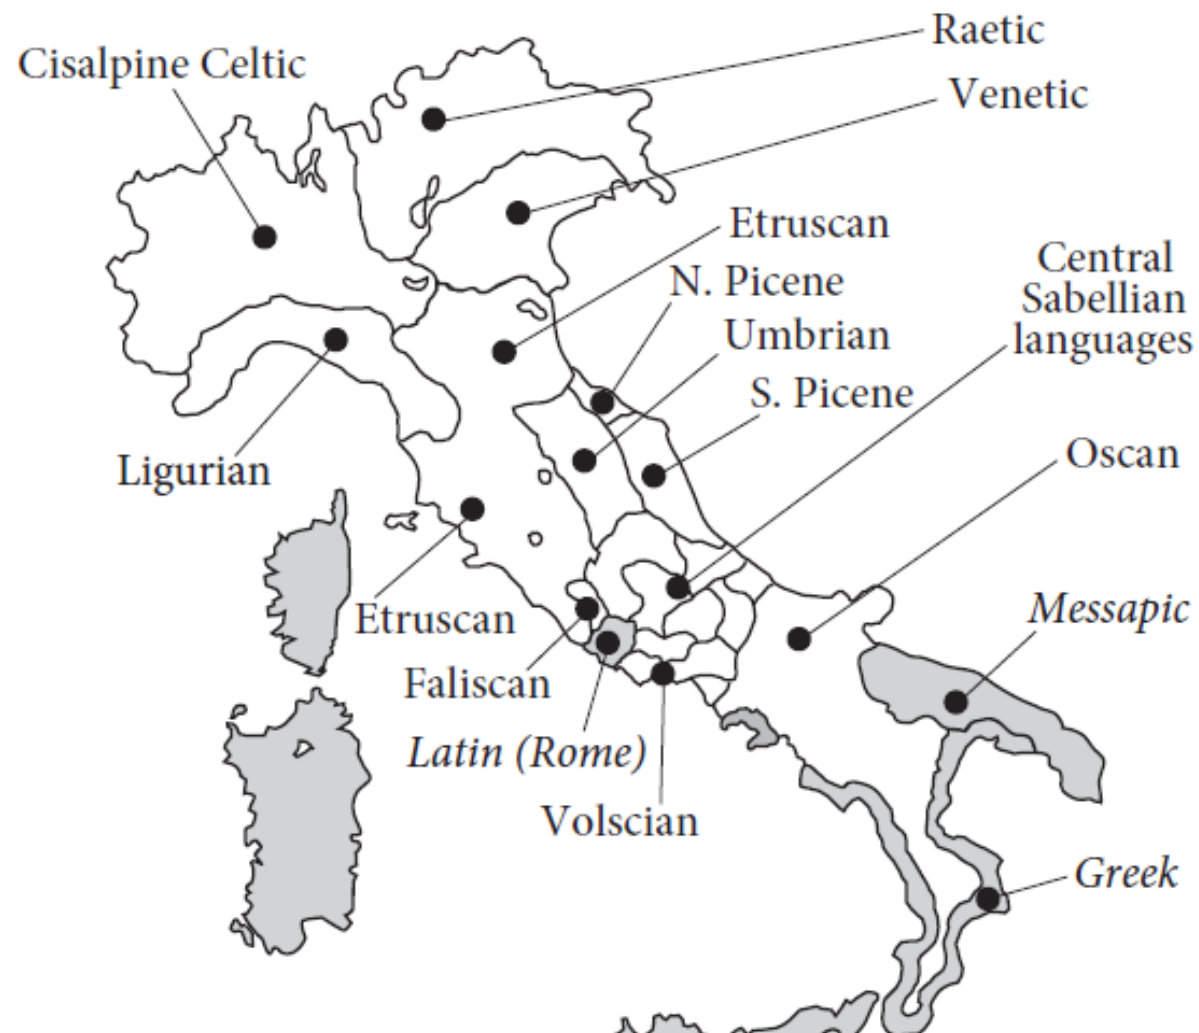

- This presentation is based on work of David Perry, developer of Italice Vetus font (available at: <http://www.scholarsfonts.net/>)

OLD ITALIC

0	 10300	 10310	 10320
1	 10301	 10311	 10321
2	 10302	 10312	 10322
3	 10303	 10313	 10323
	 10304	 10314	 10324

- “Old Italic” block unifies various related alphabets of Italy
- Used by various languages
- Ultimately derives from a form of 8c BCE Greek (Euboean Greek used in area of Bay of Naples)

OLD ITALIC

OLD ITALIC FEATURES

- Many glyph variants within languages and across languages

HE in Code Chart

Faliscan

Umbrian

Archaic Etruscan

- Default direction in Unicode is strong left-to-right, but many inscriptions are right-to-left

OLD ITALIC – IN UNICODE

- Script block approved in Unicode 3.1 in 2001
- “The unification of these alphabets into a single Old Italic script requires ***language-specific fonts*** because glyphs most commonly used may differ somewhat depending upon the language being represented” – The Unicode Standard

OLD ITALIC – IN UNICODE

- Range of glyphs increased in 2015, when the definition of “Old Italic” expanded to include a few additional alphabets of northern Italy
- Expanded set of glyphs made available in Unicode Technical Note #40: Old Italic Glyph Variation (August 2015)

UTN 40: OLD ITALIC GLYPH VARIATION (AUG. 2015)

	<i>Mar</i>	<i>Et1</i>	<i>Et2</i>	<i>Osc</i>	<i>Umb</i>	<i>Fal</i>	<i>NPi</i>	<i>SPi</i>	<i>Ven</i>	<i>Rae</i>	<i>Cis</i>
A	𐌰	𐌰	𐌰	𐌰𐌱	𐌰	𐌰𐌱	𐌰	𐌰𐌰	𐌰𐌰𐌱	𐌰𐌰	𐌰𐌱𐌰
HE	𐌺	𐌺	𐌺𐌾		𐌾	𐌺𐌺		𐌺𐌺	𐌺𐌺𐌾	𐌺𐌺	
THE	𐌸	𐌸	𐌸𐌾		𐌸	𐌸	𐌸	𐌸𐌸	𐌸𐌸𐌸	𐌸	𐌸

OLD ITALIC GLYPH VARIATION – RAETIC

Character variants

Letters

Nr.	Char.	Name	Variants (←)
1	A	alpha	

OLD ITALIC – DEVELOPMENT AND PROBLEMS

Fonts

- Past: “Hacked” fonts for variants (Etruscan from Altsys, Etruscotutto, Linguist’s Software Archaic Alphabets)
- Recently: Unicode font but PUA for variants (Alphabetum)

Note: Noto Sans Old Italic and Windows Segoe UI Historic: support Unicode Old Italic chart characters, but don’t include variants

Software

Slow software support for OpenType features + Plane I characters

OLD ITALIC – REQUIREMENTS FROM USERS

1. Access to large number of variant glyphs
2. Font that works with off-the-shelf applications
3. Ability to represent text as R-to-L in some situations

OLD ITALIC – OPTIONS FOR ACCESSING VARIANTS

Based on comments from David Perry

OPTIONS: PUA

Pros: Can add large # of glyphs

No gate-keeper (such as UTC) restricting which characters can be included

Cons: Not reliable for general interchange

OPTIONS: VARIATION SEQUENCES

Variation sequences: can be used where different shapes of characters are not predictable

Pros: Captures variation in plain-text

Supported in many applications

Cons: Need to be approved by UTC

Large # of glyphs would require a large # of VSes

OPTIONS: OPENTYPE FEATURE CHARACTER VARIANTS

Character variants: designed to apply one of many variants to a single character at a time

Pros: Can support a large number of variants

Cons: Few applications support this feature

OPTIONS: OPENTYPE FEATURE STYLISTIC ALTERNATES

Stylistic alternates: provide access to aesthetic variants

Pros: Can include more than one alternate shape/character

Supported in more applications than Character Variants

Cons: Challenging for a user when there are large numbers of variants to pick from

OPTIONS: OPENTYPE FEATURE STYLISTIC SETS

Stylistic set: a group of shapes that typically appear together

Pros: Fairly well supported in software

Cons: Doesn't work as well when large numbers of variants are involved

OPTIONS: OPENTYPE FEATURE LOCALIZED FORMS

Localized forms: for text tagged as a specific language, this feature substitutes shapes as appropriate

Pros: Could be useful if there were few variants to pick from

Cons: Not a good option when user needs to pick from a variety of forms

APPROACHES

- Pan-Old Italic font by David Perry “Italica Vetus” with variants accessible both in PUA and via OpenType Character Variants feature (but recommends eschewing PUA)
- Language-specific fonts possible (and may allow use of different OpenType features to access variants)

Q: Will there be good support of OT features coming?

SIDE ISSUE: OLD ITALIC R-T-L SUPPORT: PROBLEMS IN OVERRIDING DIRECTIONALITY

- Unicode Bidirectional Algorithm enables directional overrides through the override controls (RLO and LRO)
 - many programs ignore these controls
- The OpenType spec says that mirrored glyphs should be applied when a run of text requires them (such as when the user inserts an RLO)
 - most programs do not apply OT features enabling this to work (<rtla> and <rtlm>)

VIEWS FROM KAMAL MANSOUR (LINGUISTIC TYPOGRAPHER, MONOTYPE)
